

ANNUAL SCREENING FOR LUNG CANCER: WHO IS MOST AT RISK?

LUNG CANCER IS

- Diagnosed in approximately 1 of every 7 cases of cancer¹
- The leading cause of cancer deaths in the United States at 25.9%^{1,2}
- The cause of more cancer deaths than prostate, breast, and colorectal cancers combined¹⁻⁵

THERE ARE APPROXIMATELY

current and former smokers at high risk for lung cancer in the United States^{6*}

LDCT=low-dose computed tomography.

*According to United States Preventive Services Task Force criteria.

LDCT SCREENING MAY DETECT LUNG CANCER EARLY IN THESE PATIENTS^{7,8}

WHO IS AT HIGH RISK?

Patients at high risk include those who meet all of the following criteria⁹:

- Are 55 to 80 years old
- Have a smoking history of ≥ 30 pack-years[†]
- Are currently smoking or who have quit within the last 15 years

Lung cancer screening is covered by Medicare for patients 55 to 77 years old and by most commercial insurance plans for patients 55 to 80 years old.^{10,11}

[†]Number of cigarette packs smoked per day multiplied by the number of years a person has smoked.

Make time to talk about screening.
